Introdução

Desmatamento na Amazônia

Mais de 20% da floresta foi desmatada durante os últimos 30 anos (KHANNA et al., 2017)

KHANNA, Jaya et al. Regional dry-season climate changes due to three decades of Amazonian deforestation. Nature Climate Change, v. 7, n. 3, p. 200-204, 2017.

Introdução (contexto)

Monitoramento do desmatamento por imagens de Sensoriamento Remoto

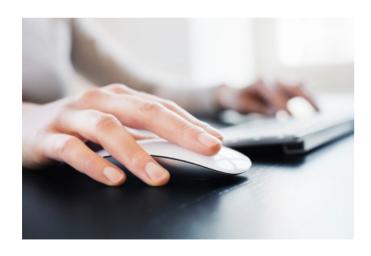

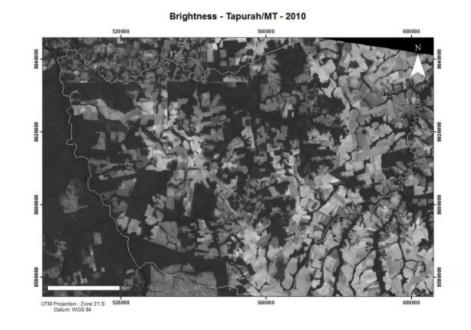

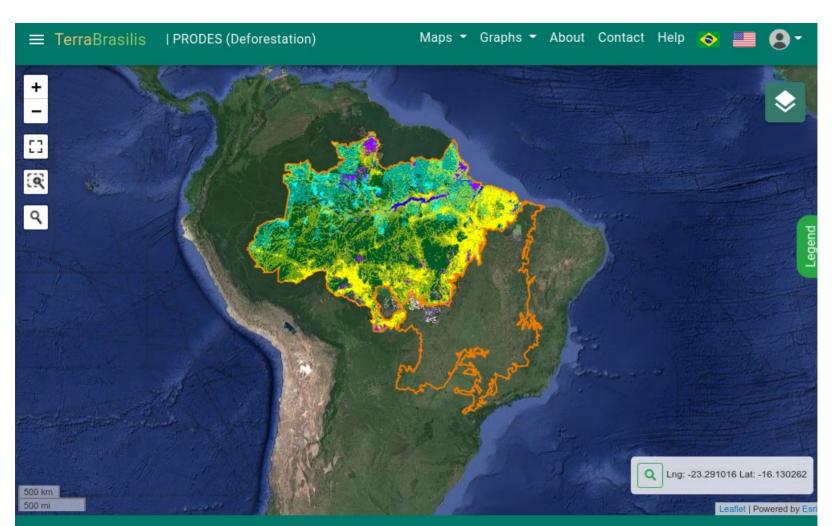

http://www.seer.ufu.br/index.php/braziliangeojournal/article/view/24886

Problema

O PRODES é um projeto desenvolvido pelo INPE e mapeia os polígonos de desmatamento por fotointerpretação das imagens de satélite por especialistas, e fornece as taxas de desmatamento uma vez por ano (INPE, 2019)

Solução

Para agilizar a quantificação do desmatamento na Amazônia, pode-se utilizar o conhecimento dos especialistas do PRODES para treinar algoritmos de Machine Learning.

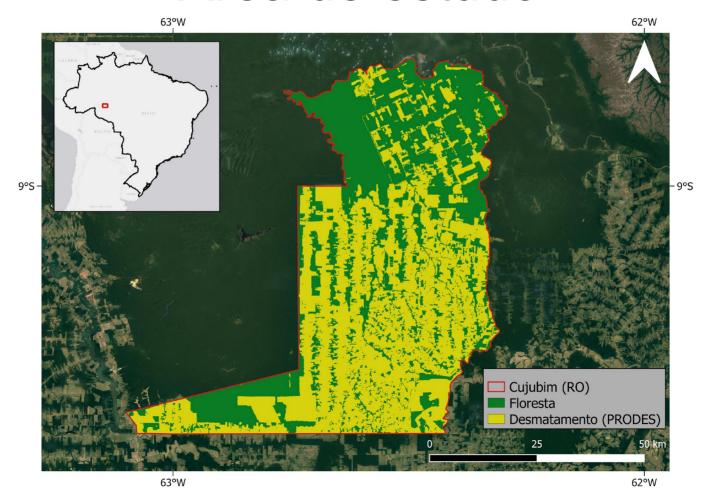

Objetivos

- 1) Classificar desmatamento em séries temporais (2015-2021) de imagens de satélite (Landsat 8/OLI) a partir de um algoritmo de Machine Learning treinado com amostras do PRODES.
- 2) Avaliar e comparar o desempenho de diferentes algoritmos.

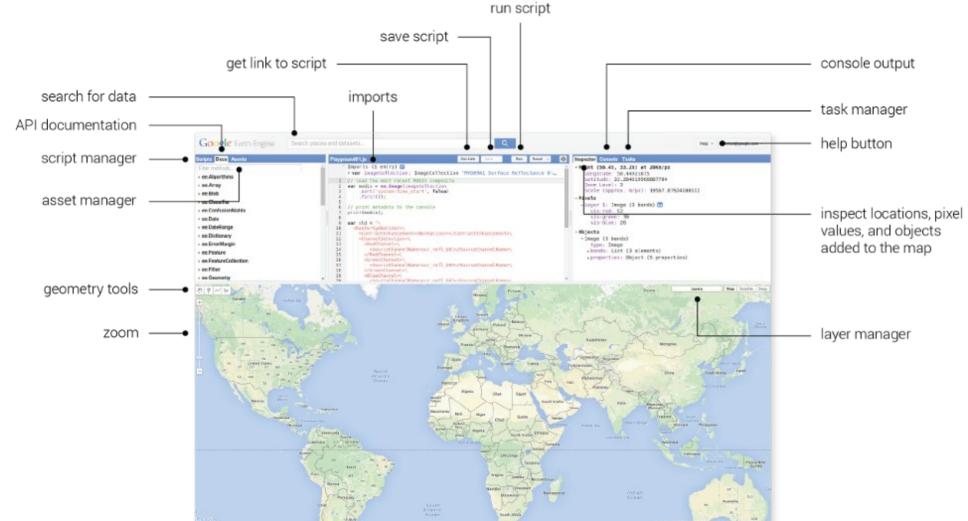

RandomForestClassifier, LogisticRegression, XGBClassifier, KneighborsClassifier, BaggingClassifier, ExtraTreesClassifier, SVC, NuSVC, LinearSVC,BernoulliNB, LGBMClassifier,MLPClassifier,

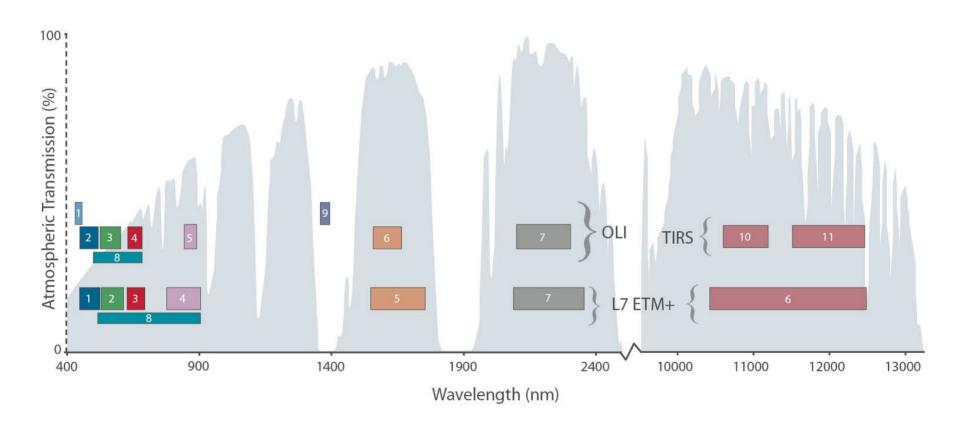

AdaBoostClassifier

Área de estudo

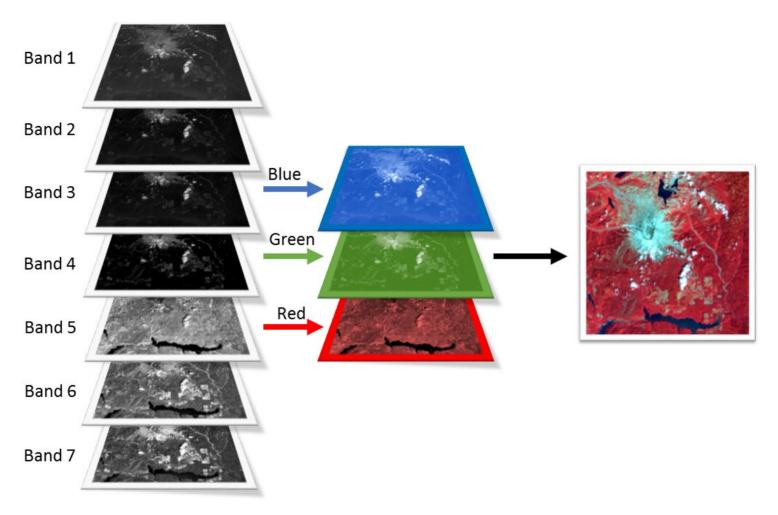

Processamento de Imagens (Google Earth Engine)

Modelo em produção

Planos futuros

1) Testar o modelo em áreas em que não houve coleta de amostras.

2) Publicar artigo científico.

3) Aprofundamento em Deep Learning e em visão computacional.
